Exercise 1 The function given by $f(x) = 3(x-2)^2 + 1$ (graphed below) is not a one-to-one function on $(-\infty, \infty)$. If we restrict the domain, however, it can be made to be one-to-one.

Find a formula for $f^{-1}(x)$ when f is restricted to $(-\infty, 2]$.

$$f^{-1}(x) = 2 - \sqrt{\frac{x-1}{3}}$$

Hint: We're starting with y = f(x), so that's:

$$y = 3(x-2)^2 + 1$$

Swap x and y.

$$x = 3(y-2)^2 + 1$$

Solving for y you find two solutions. They are:

$$y = 2 - \sqrt{\frac{x-1}{3}}$$

$$y = 2 + \sqrt{\frac{x-1}{3}}$$

The domain of f was restricted to $(-\infty, 2]$, which means we want the range of f^{-1} to be $(-\infty, 2]$. Which of the two solutions you found give outputs which are not greater than 2?
